

Quantitative analysis of the first responses of first aiders to a simulated "struck-by" accident

1999

Abstract: The purpose of this study was to determine the first response of first aiders to a simulated "struck-by" accident. The study was conducted in a controlled environment. The first aiders were trained in first aid and were given a written protocol. The results of the study showed that the first aiders responded quickly and effectively to the simulated accident. The first aiders were able to identify the victim, assess the situation, and provide first aid. The study also found that the first aiders were able to communicate effectively with the victim and the other first aiders. The study was limited by the fact that it was conducted in a controlled environment and the results may not be generalizable to real-world situations.

Keywords: first aid, first aiders, first response, struck-by accident

1. Introduction

The purpose of this study was to determine the first response of first aiders to a simulated "struck-by" accident. The study was conducted in a controlled environment. The first aiders were trained in first aid and were given a written protocol. The results of the study showed that the first aiders responded quickly and effectively to the simulated accident. The first aiders were able to identify the victim, assess the situation, and provide first aid. The study also found that the first aiders were able to communicate effectively with the victim and the other first aiders. The study was limited by the fact that it was conducted in a controlled environment and the results may not be generalizable to real-world situations.

CONCLUSIONS

The first aiders responded quickly and effectively to the simulated accident.

The first aiders were able to identify the victim, assess the situation, and provide first aid. The study also found that the first aiders were able to communicate effectively with the victim and the other first aiders. The study was limited by the fact that it was conducted in a controlled environment and the results may not be generalizable to real-world situations.
